

Business process transformation

Manual re-entry, approval queues, and unclear handoffs create delays and rework. Redesign the process before adding automation, connecting records and decisions around a business outcome with explicit ownership for exceptions and consequential actions.

Capabilities

- Map current work, wait times, duplicate entry, and the causes of recurring exceptions.
- Design a simpler future-state flow across sales, service, finance, or operations.
- Connect approved business and collaboration systems with deliberate data ownership and access.
- Define human decisions, automated actions, approval thresholds, and recovery from failed steps.
- Plan representative acceptance tests, user adoption, release controls, and support handover.

Deliverables

- A current-state process map and baseline showing bottlenecks, handoffs, and rework drivers.
- A future-state design with decision rights, approvals, and exception-routing rules.
- An integration blueprint and prioritized implementation backlog with system dependencies.
- Acceptance scenarios and operating runbooks covering failures, duplicate actions, and escalation.

Business value

Create a process people can operate and improve, not just an automated sequence. Track cycle time, first-time quality, exception volume, and service outcomes against the baseline while retaining required approvals and auditability.

Start with one important process and its business owner.

Start with one important process and its accountable owner. Bring sample cases, systems, volumes, and common exceptions. Financial, contractual, and externally consequential actions require explicit authorization and agreed controls.
