

Custom AI solutions and governance

Design assistants and agents that use approved business context, respect access, and connect to the right tools. Make usefulness, quality, and safety part of the same decision.

Capabilities

- Assess use-case feasibility, ownership, and data requirements.
- Design answers based on approved sources and useful references.
- Review Model Context Protocol servers, approved integrations, and narrowly scoped tools.
- Evaluate successful tasks, denied access, and harmful inputs.
- Plan release decisions, monitoring, and retirement.

Deliverables

- A solution and governance blueprint.
- A scoped prototype and knowledge-source design.
- An evaluation dataset and release criteria.
- A production-readiness and improvement backlog.

Business value

A clearer case for a useful, governed artificial intelligence (AI) solution. Discuss groundedness, task success, safe failure, latency, and cost per useful interaction.

Start with a scoped use case and clear boundaries.

Bring the task, approved information, accountable owner, and intended integrations. A prototype is not production assurance; expanded permissions require explicit review.
