

Data security

Make sensitive data visible and its handling deliberate. Connect discovery, ownership, classification, access, and protection to the way your organization collaborates and adopts artificial intelligence (AI).

Capabilities

- Review data exposure, oversharing, and ownership.
- Define a practical classification and labeling taxonomy.
- Design supported data loss prevention and information-protection policies.
- Assess retention, audit, and insider-risk requirements.
- Connect AI readiness to appropriate access and data use.

Deliverables

- A scoped data-risk and repository assessment.
- A classification and handling model.
- A staged protection-policy and exception plan.
- Control-to-evidence mapping and operational responsibilities.

Business value

Clearer data boundaries and a practical protection roadmap. Discuss classification coverage, excess access, policy exceptions, and evidence completeness.

Start with a data protection and readiness assessment.

Bring priority repositories, information owners, collaboration patterns, and applicable obligations. Legal and privacy stakeholders determine requirements; configuration alone is not compliance.
