

Threat protection

Connect identity, endpoint, email, and cloud protection through extended detection and response (XDR). Prioritize risks and give your team a clear response plan.

Capabilities

- Identify important business systems and their protection needs.
- Review identity, endpoint, email, and cloud protection coverage.
- Assess prevention and high-risk configuration gaps.
- Map protection decisions to relevant business threats.
- Stage changes with operational owners and rollback criteria.

Deliverables

- An in-scope asset and exposure inventory.
- A protection-coverage and control-gap assessment.
- A risk-ranked hardening and remediation backlog.
- A phased implementation and verification plan.

Business value

A more consistent defense and clearer remediation priorities. Discuss coverage, critical-gap closure, and backlog age; no breach-prevention guarantee is implied.

Start with a threat-protection readiness review.

Bring the critical services, existing protection tools, known exposure, and change constraints. Active incident response and specialist operational-technology assessment are separate scopes.
