

Cloud modernization

Connect portfolio decisions to a governed Azure foundation. Assess what to retain, retire, migrate, or modernize, then sequence change around business dependencies.

Capabilities

- Assess applications, dependencies, and readiness constraints.
- Design landing zone, identity, network, and policy foundations.
- Define workload disposition and migration waves.
- Plan security, performance, recovery, and cost requirements.
- Establish pilot, cutover, rollback, and handover criteria.

Deliverables

- A portfolio assessment and dependency map.
- A target architecture and design-decision record.
- A migration and modernization roadmap.
- Operational acceptance and recovery requirements.

Business value

A clearer path through technical debt and workload risk. Discuss readiness, validated reliability, recovery outcomes, and operating cost against a baseline.

Start with a bounded portfolio or platform assessment.

Bring business-critical workloads, technical dependencies, platform constraints, and upcoming change windows. Validate regional availability, licensing, and data residency requirements.
