

Governed data and analytics

Build trusted data products for business intelligence (BI) and artificial intelligence (AI). Bring ingestion, transformation, meaning, access, and ownership into one governed design.

Capabilities

- Assess sources, integration patterns, and data ownership.
- Design lakehouse, warehouse, and semantic-model architecture.
- Define quality, lineage, classification, and access requirements.
- Prioritize useful analytical and AI knowledge foundations.
- Establish data-product operations and change ownership.

Deliverables

- A data-platform and integration blueprint.
- Prioritized data products and shared definitions.
- Quality, access, and acceptance criteria.
- A reporting pilot and governance operating model.

Business value

More trustworthy information and less reconciliation effort. Discuss freshness, quality-rule coverage, consistent definitions, and time to produce a reliable insight.

Start with a business question and the data it needs.

Bring source owners, current reports, access requirements, and known quality issues. Minimize personal data and validate permitted reuse before integrating sources.
