

Modern security operations

Modernize security operations with extended detection and response (XDR), relevant analytics, and controlled automation. Align responsibilities with the threats that matter.

Capabilities

- Assess the security operating model and escalation paths.
- Prioritize Sentinel data sources and detection use cases.
- Engineer and tune analytics with XDR investigation context.
- Design approval-controlled response automation.
- Exercise runbooks and establish continuous improvement.

Deliverables

- A security operations maturity and coverage assessment.
- A detection-engineering backlog and data onboarding plan.
- Investigation, escalation, and response runbooks.
- A measurement framework and operations handover.

Business value

More consistent triage, clearer ownership, and a measurable improvement cycle. Baseline alert quality, investigation time, and unresolved detection gaps.

Start with a security operations modernization roadmap.

Bring telemetry sources, recurring alert challenges, current workflows, and operational constraints. Monitoring hours, incident response, and service targets require a separate explicit agreement.
