

Business process transformation

Reimagine the process before automating it. Connect business records, workflow, and artificial intelligence (AI) around a measurable outcome, with explicit ownership for decisions and exceptions.

Capabilities

- Discover friction, repeated work, and approval dependencies.
- Map current and future-state sales, service, or operations flows.
- Integrate approved customer relationship management, enterprise resource planning, and collaboration records.
- Define decision rights, approvals, and exception handling.
- Plan testing, adoption, and an operational handover.

Deliverables

- A process assessment and future-state map.
- An integration design and implementation backlog.
- A decision and approval matrix.
- Acceptance criteria, runbooks, and measurement approach.

Business value

Clearer ownership and less avoidable process friction. Agree on cycle time, rework, handoff volume, and service quality measures before implementation.

Start with one important process and its business owner.

Bring the workflow, systems, common exceptions, and desired outcome. Financial, contractual, or externally consequential actions need agreed authorization.
