

Copilot readiness and adoption

Licenses alone do not make Copilot useful. Poor information access, weak task selection, and limited user support can undermine adoption. Prepare Microsoft 365 Copilot around representative roles, trusted content, and clear expectations for reviewing results.

Capabilities

- Select role-based tasks where drafting, discovery, or analysis can address a recurring work problem.
- Review licensing, identity, device, application, and information-access prerequisites.
- Identify oversharing, stale content, and protection gaps that affect permission-aware responses.
- Design practical learning, manager support, feedback collection, and issue escalation.
- Evaluate output quality and task usefulness with representative users before widening access.

Deliverables

- A role-and-task opportunity map with baseline effort, quality expectations, and content dependencies.
- A readiness report and ranked remediation backlog with accountable owners.
- A pilot charter defining participants, safeguards, evaluation tasks, and proceed-or-stop criteria.
- An enablement playbook with learning scenarios, support routes, and privacy-aware adoption measures.

Business value

Make expansion decisions using evidence of useful, responsible work rather than license activation. Compare output quality, correction effort, user confidence, and sustained adoption; any savings depend on validated changes to actual work.

Start with a focused Copilot readiness engagement.

Bring pilot roles, sample tasks, approved knowledge sources, and relevant policies. Agree the pilot boundary and remediation priorities first, then confirm current licensing and supported capabilities before rollout.
