AI Business Solutions

AI Business Solutions

Repeated tasks, fragmented knowledge, and disconnected handoffs slow teams down. Identify where better collaboration, simpler processes, and useful AI can improve everyday work, then build the business case and adoption path before expanding investment.

Capabilities

- Improve modern work productivity through Microsoft 365 collaboration, content ownership, and Viva employee experience.
- Prioritize role-based Copilot and agent use cases around real tasks and approved information.
- Redesign business processes before automating decisions, approvals, and system handoffs.
- Design custom AI with bounded access, representative evaluation, and accountable operational owners.
- Equip users and managers with role-based learning, support, and privacy-aware adoption measures.

Deliverables

- A ranked opportunity portfolio comparing business value, feasibility, readiness, and change effort.
- A current-state assessment and future-state blueprint for the selected workplace or process scope.
- A pilot charter with baseline measures, success criteria, controls, and expansion decisions.
- An adoption and delivery roadmap with training, support responsibilities, and ownership.

Business value

Focus investment on useful work improvements rather than isolated tool rollout. Measure task quality, process friction, and sustained adoption alongside the cost of change; usage alone is not evidence of financial return.

Start with an AI strategy and governance roadmap.

Bring a recurring business problem, its owner, and representative tasks. Choose one workplace, process, or AI opportunity and agree the evidence needed to proceed, reshape, or stop the pilot.

Microsoft 365, Viva, Microsoft 365 Copilot, Power Apps, Power Automate, Foundry
